

W1 Exercises

 Try to finish the exercises on your own! Find a TA if you encounter any problems.

Task 0

Create a new file for your exercise!

(**Hint:** Follow the step-by-step instruction in the lecture notes if you forget)

Task 1: Assign values

Create two variables `x` and `y`, and assign values `20260910` and `1028`.

- Compute `x / y`, `x %% y`, `x %/% y`
- What's the difference? What are these numbers?

Task 2: `help()`

Use the `help()` function to check docs, e.g. `data.frame()` or `mean()`.

Task 3: Matrix

Create the following vectors:

```
fruit_vec <- c("Apple", "Banana", "Orange") num_vec <- c(25, 30, 28)
```

and create a `3x2` matrix with these two vectors.

- Print the matrix out. What do you find?
- What's the data type of the columns of the matrix?
- Do you think it is appropriate to store the data of the two vectors using a matrix? Why or Why not?
