

# W7 Exercises

Good luck on Midterm! Contact TAs if you want to arrange office hours!

## Task 0: Setup

- Download and import the dataset `loans_full_schema`

## Task 1: Wrap the Plot

- Use `loans_full_schema` to create a histogram of the variable `interest_rate`. Set the bin width to be 2.5, facet the graph by the variable `loan_purpose`, and allow each panel to have a different y-axis scaling

## Task 2: Save the Plot

- Create a folder `figures` in your project folder
- Save the plot in Task 1 to `figures` folder with name `w7_plot` without any customized settings
- Save another plot with the name `w7_plot_sized` by setting `height = 6` and `width = 4`
- Add a new setting `dpi = 150` to the last plot and rename it as `w7_plot_sized_150dpi`
- Compare the differences between `w7_plot`, `w7_plot_sized`, and `w7_plot_sized_150dpi`
